

Renewable Energy

Origin

- On Friday the 21st of August we had a visit from Ian Purcell.
- He told us about the different types of reusable energy and some of the non renewable energy sources.

Parts of a wind mill

- The parts of a wind mill are the turbines which are made from fibreglass which is a type of glass and plastic.

The second part

- The second part is the motor and this weighs about 4 tonnes
- How heavy is that!
- This engine is the main part of the wind mill if something goes wrong here the whole thing shuts down

The other two parts

- The other two parts are the towers which join up to make one big tower which is about 80 meters up - man that is massive.

THIS IS A

DEDICATION TO

WIND MILLS

EVERYWHERE
